

Straight talk about crooked teeth

It is proven that early intervention can dramatically reduce the need for braces. This can result in a simplified and shortened treatment.

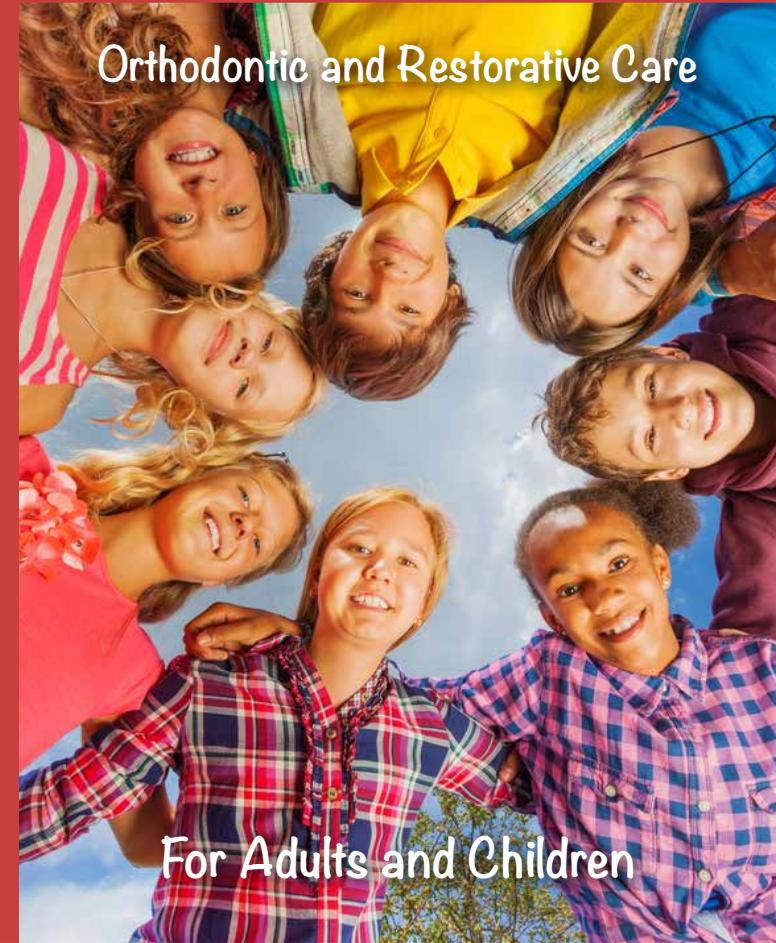

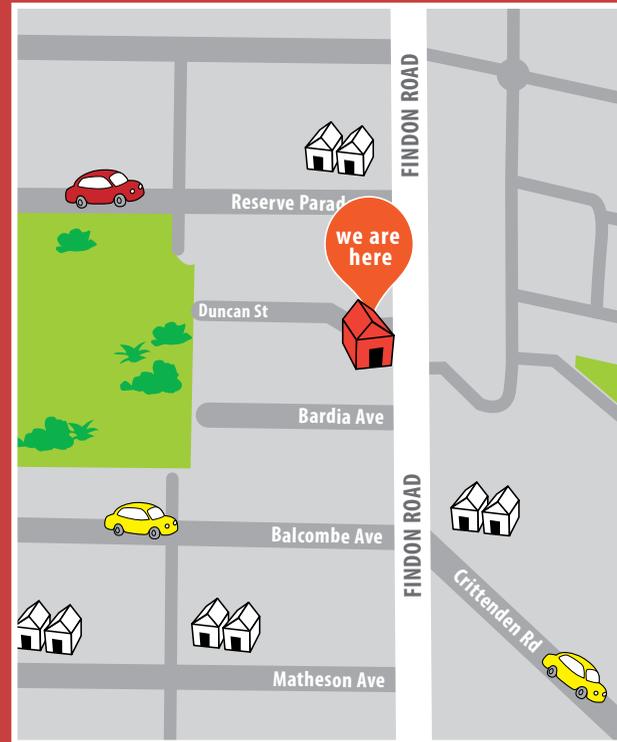

If you are interested in considering an alternative to braces, contact us for a **COMPLIMENTARY ORTHODONTIC CONSULTATION** to see if "BRACE FREE ORTHODONTICS" is right for you.

Our Practice believes that every child deserves a great smile!

Welcome to our Practice

You may know somebody who has had braces and now has straight teeth, but their face does not look balanced when they smile. This may be because extractions were performed towards the front of their mouth, giving them a narrow smile.

Using our **BRACE FREE ORTHODONTIC** technique, we often avoid the extraction of healthy adult teeth. Our treatment aims for harmony between the teeth, jaws and face, which leads to a fantastic smile. This is achieved, in suitable cases, by expansion and correction of the upper and lower dental arches using removable appliances.

Early treatment can reduce or even eliminate the need for braces

Does your child have any of the following?

- Suffers from frequent colds, throat or ear infections
- Difficulty breathing through the nose
- Thumb Sucking habits

MICHELLE age 11
BEFORE

- Narrow arches
- Crowded out canine teeth
- Receding lower jaw

MICHELLE
AFTER

- Arches developed with removable appliances
- Teeth straightened with braces
- NO extractions required

The results include a full broad smile, a pleasing facial profile & retention of healthy pre-molar teeth.

The right age to come in for orthodontics?

Orthodontics can be done at any age including adulthood, but it is much easier when children are young. So as not to miss the opportunity to begin treatment at the ideal time, the earlier we see your child the better.

CARL age 10
BEFORE

- Narrow arches
- 10mm overjet
- Frequent dizzy "headaches"

CARL
AFTER

- Upper jaw widened
- Removable appliances only
- NO braces
- NO extractions required
- NO more head aches

Treatment can be initiated and completed at an early age with reduced incidence of relapse.
